Crime Admin User Portal

Iteration 2

Team Members

John Symanski

Jude King

Ryan Schlechty

Carter Jeurissen

Dawson Davis

Client Information

Chuqlab: Based out of Indianapolis

Crime miner software: Software transcribes video and audio and allows you to search through transcriptions for keywords

Mentor Feedback

For our mid-iteration meeting, we presented our project to our mentor Casey. He gave an idea on how to set up the manual for both front and back ends, while telling us to use a mock database to stay on track, should our client not give permission to read/write to their database. While we have not set a mock database, we did set up the manual for the front and back ends.

For the pre-client meeting with our mentor to wrap iteration 2 out, we received positive feedback for the project, such as saying we're a lot better off this iteration than last. We went over documentation and our software, adding Flyway to the back-end documentation, and searching for a way to solve a bug in the software.

Client Feedback

Client was satisfied with current state of project. Suggested disabling certain buttons until required fields were filled. Client also suggested that we look into using Ngx Datatable as a library to help improve project. We also discussed next steps they wanted us to prioritize.

Organizations Display from DB - Add Organizations

Users Display from DB - Add/Remove Users

Planned Iteration 3 features

- Admins can add/remove users

- Admins can edit a user's username, email, and admin status after they've been created

- Super admins can edit all user information after they've been created

- Super admins can edit all organization information after they've been created
